Therefore assuming  $m\$ 2$ , the first operation gives  $n 209$ , and the second  $m\$ = 209056926$ , for the required value of  $At$ ; or the length of the chord of  $2$  degrees, when the radius is unity, which is true to the, last figure. 13. As it may be of some use to the young Algebraist, I shall now endeavour to illustrate, by a few Examples, the Newtonian method of obtaining the roots of literal equations., Example 1. Given,  $y--axy--ay--x = o$ . Requited the value of  $y$ , in a series composed of the powers of  $a$  and  $x$ , with their coessicients. The first thing to be done is to tabulate the equation, which is easily effected as follows: Make a right angle  $DAB$  (sig. 10.), and from  $A$  towards  $B$  write down all the powers of  $y$ , and from  $A$  towards  $D$  all the powers of  $x$ , as high as in the given equation, beginning from unity. Divide the whole into small squares or parallelograms, as in the scheme, and insert the terms of the equation in their corresponding squares or parallelograms, that is, in those which have the fame powers of  $x$  and  $y$ ;...
